PROFILE

Data Science & AI student at BUas (graduating July 2027), looking for a graduation internship in data or AI engineering from February 2027. I like finding patterns in messy data and turning models into real products, from analysing the JD Edwards configurator at Vlisco to deploying AI features as an ML engineering intern at a startup.

EXPERIENCE

- **Vlisco** Sep. 2026 – Present
Data-Driven Configurator Optimization Intern
 - Analysing the product configurator that generates routings and bills of material for wax-print fabric in an ERP environment.
 - Auditing large table exports with Python and SQL to map the rule structure and flag redundant logic, validated against production history.
- **Cognita Innovative Solutions** Feb. 2026 – Jun. 2026
Machine Learning Engineer Intern
 - Built backend APIs and configured Alibaba Cloud services (OSS, DirectMail, Message Service) for a production multi-product platform.
 - Implemented vector similarity search with Milvus on Alibaba Cloud, returning matches within seconds.
 - Built an OCR business-card scanner (ML Kit) for Chinese and English cards and integrated on-device Whisper speech-to-text for offline use.

PROJECTS

- **Predictive Truck Maintenance – Industry Collaboration** Code under NDA
Tools: Python, SQL, Docker, Scikit-learn
 - Built a containerized anomaly-detection pipeline for a heavy-vehicle fleet, combining SQL data, telemetry parsed from PDF reports and RDW vehicle records.
 - Trained an ensemble model optimised for recall, so upcoming failures are rarely missed, to support maintenance scheduling.
- **Transport Incident Prediction – with ANWB** Code under NDA
Tools: Python, SQL, XGBoost
 - Built SQL ETL pipelines combining historical incident and weather data from messy real-world sources.
 - Engineered features and trained XGBoost models to predict traffic incidents for emergency response planning.
- **Emotion Classification Deployment** 
Tools: Hugging Face (RoBERTa), FastAPI, Docker, Azure ML
 - Built an NLP pipeline (speech-to-text, preprocessing, RoBERTa classification) served with FastAPI in Docker on Azure ML for real-time inference.
- **NAC Breda Player Value Analysis** 
Tools: Python, Scikit-learn, Pandas
 - Built predictive models estimating players' market value from performance metrics to support the club's scouting, handling player data under GDPR.
- **Automated Root Segmentation** 
Tools: TensorFlow, OpenCV
 - Built a U-Net segmentation pipeline with OpenCV preprocessing to measure plant root length automatically, replacing manual measurement.

EDUCATION

- **Breda University of Applied Sciences** Sep. 2023 – Jul. 2027 (expected)
BSc Applied Data Science & Artificial Intelligence
Breda, Netherlands
 - Focus: Data Engineering, Deep Learning, Computer Vision.

SKILLS

- **Languages:** Python, SQL
- **Data:** Pandas, ETL pipelines, data modelling, Power BI, Plotly
- **Machine Learning:** Scikit-learn, XGBoost, PyTorch, TensorFlow, OpenCV, Hugging Face, Whisper
- **Cloud & DevOps:** Docker, FastAPI, Azure ML, Alibaba Cloud, Milvus, Git/GitHub
- **Spoken Languages:** English (fluent), Romanian (native)
